### Step motor driver

MicroSteps Setting:400~51200 AC : 24~80V D

/ DC:24~110V

#### Overview

**DQ860HA** 

- The latest 32-bit digital processing technology
- advanced control algorithm for variable current and variable frequency conversion
- Low heat generation, low motor vibration and stable operation
- Built-in micro-segmentation
- Smooth operation and low noise
- Integrated parameter power-on auto-tuning function
- Subdivision setting (within 400~51200)

~ IN II 1540

With overcurrent, overvoltage, undervoltage protection

1004A \$1.964E 16 16.987	
	Features
Input voltage	24~80VAC/24~110VDC
Output current	2.1~7.2A (PEAK)
Pulse frequency	0~100KHz
MicroSteps	16 MicroSteps
Signal current	7~20mA
Using environment	0 ~ 70 ℃, avoid dust and corrosive gas
Storage environment	-20~+80°C , avoid direct sunlight

Generally speaking, the power supply voltage is a little higher, and the motor's high-speed performance will be relatively low when the power supply voltage is good. It is suggested that the normal operating speed range is 36V above power supply for high-speed operation.

LED status indication									
Number of flashes	Red LED flashing waveform	Fault description							
1	ΓΓ	Overcurrent or phase-to-phase short circuit fault							
2		Overvoltage fault							
Motor no power									

Symbol	Name	Remark
A+	Phase A+	
A-	Phase A-	
B+	Phase B+	
B-	Phase B-	
AC	AC power input	
AC	AC power input

PUL+	Pulse signal +							
PUL-	Pulse signal -	1						
DIR+	Direction signal+	/						
DIR-	Direction signal-	/						
ENA+	Enable signal +	Only connected when used						
ENA-	Enable signal -	Only connected when used						

### Strengthen the heat dissipation method

1) The reliable operating temperature of the driver is usually within 66 °C, and the motor operating temperature is within 85 °C;

2) It is recommended to use the automatic semi-flow mode when using the motor. When the motor stops, the current is automatically reduced by half to reduce the heat of the motor and the drive;

3 ) Install the drive with vertical side mounting, so that the heat dissipating teeth form a strong air convection; if necessary, install a fan near the drive to force heat dissipation to ensure that the drive works within a reliable operating temperature range.

#### Wiring requirements

1) In order to prevent the driver from being disturbed, it is recommended to use the shieldedcable for the control signal, and the shield layer is shorted to the ground wire. Unless otherwise specified, the shielded cable of the control signal cable is grounded at one end: theupper end of the shielded wire is grounded, and the shielded wire The drive is suspended at one end. Only the grounding at the same point is allowed in the same machine. If it is not a real grounding wire, the interference may be serious. At this time, the shielding layer is not connected.

2) The pulse and direction signal lines and the motor lines are not allowed to be bundled side by side, preferably separated by at least 10 cm. Otherwise, the motor noise easily interferes with the pulse direction signal, causing the motor to be inaccurately positioned, and the system is unstable.

3) If one power supply is provided for multiple drives, parallel connections should be made at the power supply. It is not allowed to connect one to the other and then to another chain.

4) It is forbidden to electrify the P2 terminal of the driver. When the charged motor stops, there is still a large current flowing through the coil. Pulling the P2 terminal will cause a huge moment to induce the electromotive force to burn the driver.

5) It is strictly forbidden to add the tin to the terminal after adding the tin, otherwise the terminal may be overheated due to the contact resistance becoming larger.

### Output current setting value

For the same motor, the larger the current setting value, the larger the motor output torque, but the heat of the motor and the driver is also more serious when the current is large. The magnitude of the specific heat generation is not only related to the current set value, but also to the type of exercise and the dwell time. The following setting method uses the rated current value of the stepping motor as a reference, but the optimum value in practical applications should be adjusted based on this. In principle, if the temperature is very low (<40 °C), the current setting value can be appropriately increased to increase the motor output power (torque and high-speed response).

1) Four-wire motor: The output current is set to be equal to or slightly smaller than the rated current of the motor;

2) Six-wire motor high torque mode: the output current is set to 50% of the rated current of the motor unipolar connection;

3) Six-wire motor high-speed mode: the output current is set to 100% of the rated current of the motor unipolar connection;

4) Eight-wire motor series connection method: the output current can be set to 70% of the rated current of the motor unipolar connection;

5) Eight-wire motor and connection method: The output current can be set to 140% of the rated current of the motor unipolar connection.

#### Motor selection

The DQ860HA can be used to drive 4, 6 and 8 wire two-phase, four-phase hybrid stepping motors with a step angle of 1.8 degrees and 0.9 degrees. When selecting a motor, it is mainly determined by the torque and rated current of the motor. The torque is mainly determined by the size of the motor. The large-sized motor has a large torque; the current is mainly related to the inductance, and the small-inductance motor has high-speed performance, but the current is large.

Determine the load torque, the ratio of the working speed range:

#### T motor = C (J $\epsilon$ + T load)

J: Moment of inertia of the load ɛ: Maximum angular acceleration of the load C: Safety factor, recommended value 1.2-1.4 T load: maximum load torque, including effective load, friction, transmission efficiency and other resistance torque

Frequently questions and troubleshooting	
The motor does not turn:	
Check if the power supply circuit is powered normally	
Whether the signal current is increased to 7-16mA	
Whether the subdivision is selected	
■Is the current selected?	
Motor steering error:	
The motor line phase sequence is wrong, you need to exchange any two wires.	alle
The motor line has an open circuit, check and connect	
The alarm indicator lights up:	
Whether the motor line is connected incorrectly	A VV
Is there any overvoltage and undervoltage?	LA The
■Motor or drive damage	
Inaccurate location:	
■Signal interference	
The shield is not connected or not connected.	A (0)
The motor line has an open circuit, check and connect	
■Subdivision error	NU AND A
The current is too small	
Stall when the motor accelerates:	
Short acceleration time	
■The motor torque is too small	a CAL A R.
The voltage is low or the current is too small
