LM50
SOT-23 Single-Supply Centigrade Temperature Sensor

General Description
The LM50 is a precision integrated-circuit temperature sensor that can sense a −40˚C to +125˚C temperature range using a single positive supply. The LM50’s output voltage is linearly proportional to Celsius (Centigrade) temperature (+10 mV/˚C) and has a DC offset of +500 mV. The offset allows reading negative temperatures without the need for a negative supply. The ideal output voltage of the LM50 ranges from +100 mV to +1.75V for a −40˚C to +125˚C temperature range. The LM50 does not require any external calibration or trimming to provide accuracies of ±3˚C at room temperature and ±4˚C over the full −40˚C to +125˚C temperature range. Trimming and calibration of the LM50 at the wafer level assure low cost and high accuracy. The LM50’s linear output, +500 mV offset, and factory calibration simplify circuitry required in a single supply environment where reading negative temperatures is required. Because the LM50’s quiescent current is less than 130 µA, self-heating is limited to a very low 0.2˚C in still air.

Features
- Calibrated directly in degree Celsius (Centigrade)
- Linear + 10.0 mV/˚C scale factor
- ±2˚C accuracy guaranteed at +25˚C
- Specified for full −40˚ to +125˚C range
- Suitable for remote applications
- Low cost due to wafer-level trimming
- Operates from 4.5V to 10V
- Less than 130 µA current drain
- Low self-heating, less than 0.2˚C in still air
- Nonlinearity less than 0.8˚C over temp
- UL Recognized Component

Applications
- Computers
- Disk Drives
- Battery Management
- Automotive
- FAX Machines
- Printers
- Portable Medical Instruments
- HVAC
- Power Supply Modules

**Electrical Characteristics**

Unless otherwise noted, these specifications apply for $V_S = +5$ V, $I_{LOAD} = +0.5$ mA, in the circuit of Figure 1. **Boldface** limits apply for the specified $T_A = T_J = T_{MIN}$; all other limits $T_A = T_J = +25^\circ$C, unless otherwise noted.

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its rated operating conditions.

**Note 2:** Reflow temperature profiles are different for lead-free and non-lead-free packages.

**Note 3:** Human body model, 100 pF discharged through a 1.5 k$\Omega$ resistor. Machine model, 200 pF discharged directly into each pin.

**Note 4:** Thermal resistance of the SOT-23 package is specified without a heat sink, junction to ambient.

**Note 5:** Limits are guaranteed to National’s AOQL (Average Outgoing Quality Level).

**Note 6:** Accuracy is defined as the error between the output voltage and 10mV/°C times the device’s case temperature plus 500 mV, at specified conditions of voltage, current, and temperature (expressed in °C).

**Note 7:** Nonlinearity is defined as the deviation of the output-voltage-versus-temperature curve from the best-fit straight line, over the device’s rated temperature range.

**Note 8:** Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output due to heating effects can be computed by multiplying the internal dissipation by the thermal resistance.

**Note 9:** Quiescent current is defined in the circuit of Figure 1.

**Note 10:** For best long-term stability, any precision circuit will give best results if the unit is aged at a warm temperature, and/or temperature cycled for at least 46 hours before long-term life test begins. This is especially true when a small (Surface-Mount) part is wave-soldered; allow time for stress relaxation to occur. The majority of the drift will occur in the first 1000 hours at elevated temperatures. The drift after 1000 hours will not continue at the first 1000 hour rate.
Typical Performance Characteristics

To generate these curves the LM50 was mounted to a printed circuit board as shown in Figure 2.
Typical Performance Characteristics

To generate these curves the LM50 was mounted to a printed circuit board as shown in Figure 2. (Continued)
1.0 Mounting

The LM50 can be applied easily in the same way as other integrated-circuit temperature sensors. It can be glued or cemented to a surface and its temperature will be within about 0.2°C of the surface temperature.

This presumes that the ambient air temperature is almost the same as the surface temperature; if the air temperature were much higher or lower than the surface temperature, the actual temperature of the LM50 die would be at an intermediate temperature between the surface temperature and the air temperature.

To ensure good thermal conductivity the backside of the LM50 die is directly attached to the GND pin. The lands and traces to the LM50 will, of course, be part of the printed circuit board, which is the object whose temperature is being measured. These printed circuit board lands and traces will not cause the LM50’s temperature to deviate from the desired temperature.

Alternatively, the LM50 can be mounted inside a sealed-end metal tube, and can then be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the LM50 and accompanying wiring and circuits must be kept insulated and dry, to avoid leakage and corrosion. This is especially true if the circuit may operate at cold temperatures where condensation can occur. Printed-circuit coatings and varnishes such as Humiseal and epoxy paints or dips are often used to ensure that moisture cannot corrode the LM50 or its connections.

2.0 Capacitive Loads

The LM50 handles capacitive loading very well. Without any special precautions, the LM50 can drive any capacitive load. The LM50 has a nominal 2 kΩ output impedance (as can be seen in the block diagram). The temperature coefficient of the output resistors is around 1300 ppm/°C. Taking into account this temperature coefficient and the initial tolerance of the resistors the output impedance of the LM50 will not exceed 4 kΩ. In an extremely noisy environment it may be necessary to add some filtering to minimize noise pickup. It is recommended that 0.1 μF be added from VIN to GND to bypass the power supply voltage, as shown in Figure 4. In a noisy environment it may be necessary to add a capacitor from the output to ground. A 1 μF output capacitor with the 4 kΩ output impedance will form a 40 Hz lowpass filter. Since the thermal time constant of the LM50 is much slower than the 25 ms time constant formed by the RC, the overall response time of the LM50 will not be significantly affected.

For much larger capacitors this additional time lag will increase the overall response time of the LM50.

**BANNED SUBSTANCE COMPLIANCE**

National Semiconductor manufactures products and uses packing materials that meet the provisions of the Customer Products
Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain
no “Banned Substances” as defined in CSP-9-111S2.

Leadfree products are RoHS compliant.
