

Arduino Driver SD Card

The arduino driver SD car is for the file's reading and writing

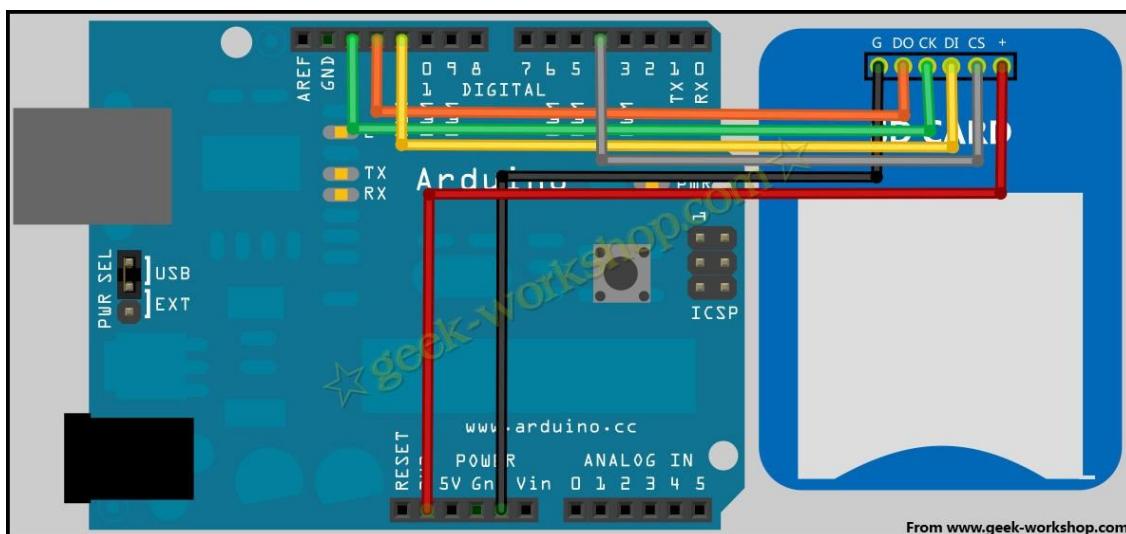

What requires special explanation is the SD library file. Currently, it can't support the card over 2G well, so I recommend 2G or less than 2G while the file is FAT format.

Therefore, I use the MicroSD card of kingmax2G.

ARDUINO SKETCH 1

```
/*
Record 3 stimulated pins to the SD card and use SD library file.
The stimulated pins connect the stimulated port 0, 1, 2. Connect to the stimulated sensor
depends on your selection. However, if the above steps are omitted, the experiment can still
be completed but the unceasingly jumping data will bother you.
```

```
SD card and arduino controlling board connect to the main SPI wire
** MOSI - pin 11
** MISO - pin 12
** CLK - pin 13
** CS - pin 4
*/
#include <SD.h>
// The CS pin is pin4, and the official default settings are also used here.
const int chipSelect = 4; // Set CS interface
// The pin of the CS is pin4. A default setting here.
const int chipSelect = 4; //Set it as CS port

void setup()
{
    Serial.begin(9600); // Set the serial communication baud rate 9600
Serial port baud rate: 9600
    Serial.print("Initializing SD card..."); // Serial port output date: Initializing SD card...
    pinMode(10, OUTPUT);
    if (!SD.begin(chipSelect)) { //If the communication from the CS port and the SD card fails,
the serial port outputs information.
Card failed, or not present
    { //If the communication fails from the CS port to the SD card, the serial port will output the
message: Card failed, or not present
        Serial.println("Card failed, or not present");
        return;
    }
    Serial.println("card initialized."); //Successful communication with SD card, serial output
information
card initialized.
}

//If the communication succeeds , the serial port will output the message: card initialized.
}

void loop()
{
// Define array
String dataString = "";

// Read the data of 3 sensors and write down the data.
for (int analogPin = 0; analogPin < 3; analogPin++) {
    int sensor = analogRead(analogPin);
    dataString += String(sensor);
    if (analogPin < 2) {
        dataString += ",";
    }
}
```

```

        }
    }

    // Open the file. Notice! You can only open one file at a time.
    //File dataFile = SD.open("datalog.txt", FILE_WRITE);

    // Open datalog.txt , reading and writing status , The file is located at the bottom of the file.

    if (dataFile) {
        dataFile.println(dataString);
        dataFile.close();
        // Array dataString output to serial port
        Serial.println(dataString);
    }

    // If you can't open the file , the serial port will output the error message: error opening
    datalog.txt
    else {
        Serial.println("error opening datalog.txt");
    }
}

```

ARDUINO SKETCH 2

/*
This example shows that how to record 3 stimulated pins to the SD card and use the SD library file

The stimulated pins connect the stimulated port 0, 1, 2. Connect to the stimulated sensor depends on your selection. However, if the above steps are omitted, the experiment can still be completed but the unceasingly jumping data will bother you.

SD card and arduino controlling board connect to the main SPI wire

```

** MOSI - pin 11
** MISO - pin 12
** CLK - pin 13
** CS - pin 4
*/

```

```

#include <SD.h>

// the CS pin is pin4, and the official default settings are also used here.
const int chipSelect = 4; // Set CS interface

// The pin of the CS is pin4. A default setting here.
const int chipSelect = 4; //Set it as CS port

void setup()
{
    Serial.begin(9600); //Set the serial communication baud rate baud rate9600
    Serial.print("Initializing SD card..."); // the serial port will output the data: Initializing SD card...
    pinMode(10, OUTPUT);
    if (!SD.begin(chipSelect)) { //If the communication from the CS port and the SD card fails, the
        serial port outputs information. Card failed, or not present If the communication fails from the
        CS port to the SD card, the serial port will output the message: Card failed, or not present
    }
}

```

```

Serial.println("Card failed, or not present");
return;
}

Serial.println("card initialized."); //Successful communication with SD card, serial output
information card initialized.

}

void loop()
{
    // Define array
    String dataString = "";
    //Read the data of 3 sensors and write down the data.
    for (int analogPin = 0; analogPin < 3; analogPin++) {
        int sensor = analogRead(analogPin);
        dataString += String(sensor);
        if (analogPin < 2) {
            dataString += ",";
        }
    } //END
}

```

//Open the file. Notice! You can only open one file at a time.
// If you want to open another file, you need to close the previous one.

```

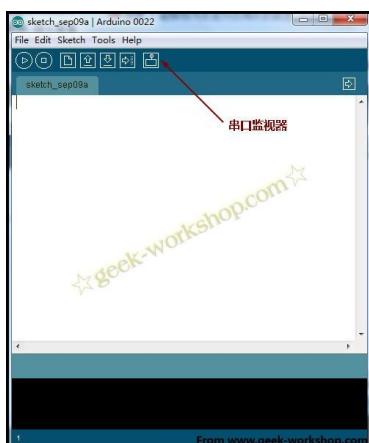

File dataFile = SD.open("datalog.txt", FILE_WRITE);

// Open datalog.txt , reading and writing status , The file is located at the end of the file.

if (dataFile) {
    dataFile.println(dataString);
    dataFile.close();
    // Array dataString output to the serial port
    Serial.println(dataString);
}
// If you can't open the file, the serial port will output error opening datalog.txt
else {
    Serial.println("error opening datalog.txt");
}
}

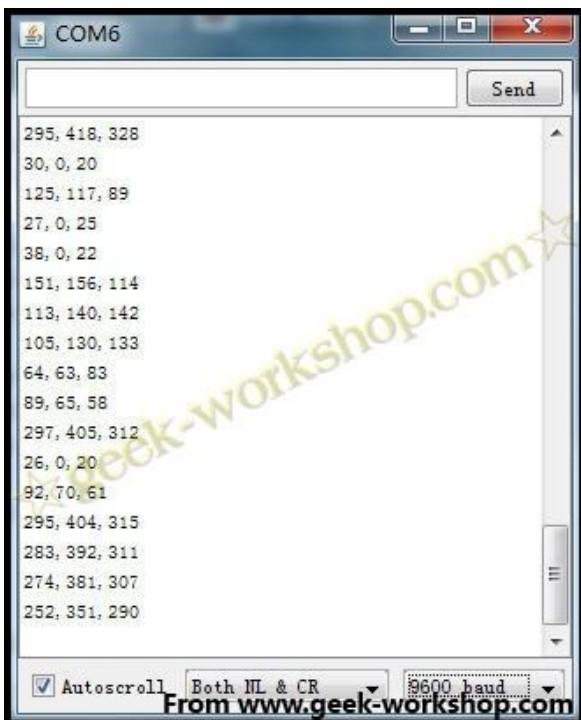

```

Open the serial monitor.

After the control panel starts working, you will see the following screen. Each row in the figure is the three sensor values recorded each time. This experiment does not connect the sensor, so the value is the messy signal of the surrounding interference source.

The control panel starts working.

Switch off the arduino, take out the SD card and connect to the computer. There is a **DATALOG.TXT** in the SD card. You could check the data of each sensor.

After the experiment of the first code, don't; delete the **DATALOG.TXT** file in SD card, and download the following code to the arduino.

ARDUINO SKETCH 3

```
/*
```

This example shows that how to read a file from the SD card through SD library file and send the data through serial port.

```
* SD card and arduino control board are connected using SPI bus
```

```

```
** MISO - pin 12
```

```

** CLK - pin 13
** CS - pin 4
*/
#include <SD.h>

// CS pin is pin4 , The official default settings are also used here.

const int chipSelect = 4; // Set CS interface

void setup()
{
    Serial.begin(9600); // Set the serial communication baud rate 9600
    Serial.print("Initializing SD card..."); // Serial output data Initializing SD card...
    pinMode(10, OUTPUT);

    if (!SD.begin(chipSelect)) { // If the communication between the CS port and the SD card fails, the
        serial port output information Card failed, or not present
        Serial.println("Card failed, or not present");
        // don't do anything more:
        return;
    }
    Serial.println("card initialized."); // Successful communication with SD card, serial output
information card initialized.

    File dataFile = SD.open("datalog.txt"); // Open the datalog.txt file
    if (dataFile) {
        while (dataFile.available()) { // Check if dataFile has data
            Serial.write(dataFile.read()); // Send data to the serial port if there is data
        }
        dataFile.close(); // Close dataFile
    }
    else {
        Serial.println("error opening datalog.txt"); // If the file cannot open the serial port, send
information error opening datalog.txt
    }
}

void loop()
{
}

```

ARDUINO SKETCH 4

```

/*
This example shows that how to read a file from the SD card through SD library file and send
the data through serial port.

```

```

* SD card and arduino control board are connected using SPI bus
SD card and arduino controlling board connect to the main SPI wire
** MOSI - pin 11
** MISO - pin 12
** CLK - pin 13
** CS - pin 4
*/

```

```

#include <SD.h>
// The CS pin is pin4, and the official default settings are also used here.
const int chipSelect = 4; // Set CS interface

void setup()
{
    Serial.begin(9600); // Set the serial communication baud rate to 9600
    Serial.print("Initializing SD card..."); // Serial output data Initializing SD card...
    pinMode(10, OUTPUT);
    if (!SD.begin(chipSelect)) { // If the communication between the CS port and the SD card fails, the
        serial port output information Card failed, or not present
        Serial.println("Card failed, or not present");
        // don't do anything more:
        return;
    }
    Serial.println("card initialized."); // Successful communication with the SD card, serial output
information card initialized.

    File dataFile = SD.open("datalog.txt"); // Open the datalog.txt file
    if (dataFile) {
        while (dataFile.available()) { // Check the dataFile to see whether there is data.
            Serial.write(dataFile.read()); // Send the data to the serial port if data exists.
        }

        dataFile.close(); // Turn off dataFile
    }
    else {
        Serial.println("error opening datalog.txt"); // If the file cannot open the serial port, send
information error opening datalog.txt
    }
}

void loop()
{
}

```

The data of the DATALOG.TXT is sent to the computer through serial port.

Type the code to the arduino control panel and open serial monitor.

ARDUINO SKETCH 5

```
/*
This example shows that create a delete file in SD card,
* SD card and arduino controlling board connect to the main SPI wire
** MOSI - pin 11
** MISO - pin 12
** CLK - pin 13
** CS - pin 4
*/
#include <SD.h>

File myFile;
